- ❖ Experienced in researching and utilizing libraries that will help meet the client's requirements
- ❖ Created/Maintained projects under different platforms such Shopify and Wix
- ❖ Has experience in creating modules and APIs for Laravel Projects (with Vue JS) and React-Native Apps

EXPERIENCE

- ❖ **Circle Business Consulting**
Remote WordPress Developer - Australia
July 2019 – Present

It's on 2019 that I decided to try and get my skills up as working on multiple projects, in different platforms, at the same time is taking away from my motivation to improve myself. I resigned from iConcept planning to take months of vacation when I receive an offer to work remotely for CBC.

My main task as a Remote WordPress Developer is to maintain, create and launch WordPress Websites based on tickets that CBC assigned to me. We do receive and dealt with occasional security-breach from clients, sometimes, with them losing complete access on their website.

We also convert websites made using other CMS into WordPress. These includes Adobe Catalyst, Drupal, and Wix.

It's rare but we do take Shopify Tasks too, but I mostly worked on content and theme modifications only. I haven't got the chance to work on creating Apps yet.

❖ **Freelance / Circle Business Consulting**
Remote WordPress Developer

I did some freelance job when my former colleagues asked for additional features or maintenance on their client's WordPress websites. Freelancing is not my focus though, and I only do it as favor for my colleagues.

❖ **iConcept Global Advertising Inc.**
Programmer and Mobile Developer
December 2017 – July 2019

As a member of the Research and Development Unit, my primary duty was to develop mobile apps based on the designs provided in Adobe XD files. I was tasked to research packages that can be used to develop modules like notifications using one signal, Zendesk implementation, google login and etc.

I also worked as backend and API developer of the apps that we create using Laravel framework. One of the backend modules tasked to me, for example, was to create a Reward Pointing System in Laravel that is capable of CRUD and able to send notification to the recipients of the Reward using OneSignal.

I also handled Corporate Type WordPress websites during this period and act as consultant of our artist when it comes to functionalities of the websites.

Web Developer
August 2015 – December 2017

As a member of the Development Unit, my duty was to develop a website based on the design and functionality that the client desires.

In the front-end side of the development, I converted the PSD Designs to its web form by utilizing HTML, PHP, Bootstrap, CSS, Javascript and jQuery.

In the back-end side of the development, it is important to customize WordPress' backend to ensure that it is user-friendly and that there are appropriate restrictions so that the client will not accidentally cause the website to crash. It is also important to make sure that appropriate measures are made to maintain the website's security.

Intern
April – June 2015

As an intern of the company's Development Department, I was trained to develop websites from its PSD form to its WordPress theme by utilizing html, bootstrap, CSS, Javascript and jQuery.
